Lab class Nº 1

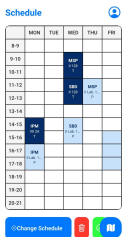

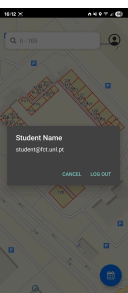

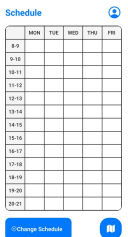

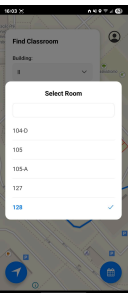

Group Nº 7

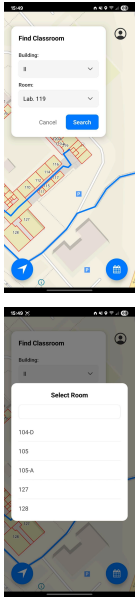

Professor:
Teresa Romão

November 30, 2025

We received Group 3's prototype on November 24. We are delivering the evaluation report on November 30.

N°	Problem	Heuristic	Description	Severity	Solution	Screenshot
1	Hidden "Add Class" Interaction	Recognition Rather than Recall	The "press and hold" gesture required to add a class manually is invisible. The user must memorize that this specific interaction exists, as there are no visual cues on the empty grid slots to prompt the action.	3 Major	Add a visible cue, such as a floating action button (+) or placeholder text on empty slots saying "Tap to add".	
2	Risk of Accidental Schedule Deletion	Error Prevention	The delete button is placed immediately next to the "Change Schedule" button. It does an immediate deletion without a confirmation step creating a high risk of accidental data loss.	3 Major	Implement a confirmation dialog before executing the delete action.	
3	Cancelling Navigation Loses Context	User Control & Freedom	When pressing "Cancel" during a route, the map resets to the user's GPS location instead of returning to the Campus Map view. The user is "trapped" outside the context of the app's main purpose.	3 Major	Ensure the "Cancel" action functions as an "Undo" or "Exit" that returns the view to the previous state (Campus Map center).	

4	Buttons Overlap/Mis alignment	Aesthetic and Minimalist Design	On the user's device, the "Map" toggle and "Confirm" check buttons overlap. This violates good graphic design principles regarding alignment and spacing.	3 Major	Adjust the layout constraints to ensure elements group with appropriate white space and do not collide on different screen sizes.	
5	Profile Button Unresponsive on Schedule	Consistency & Standards	The Profile icon is present on the Schedule page (identical to the Map page) but does not trigger any action when tapped. Users expect similar elements to act similarly across different screens.	2 Minor	Make the button functional on all screens or remove it from screens where it is not active to maintain consistency.	 
6	No Scroll Indication in Room List	Visibility of System Status	The room list cuts off cleanly at the bottom without a scroll bar or partially visible text. The system fails to inform the user that the options are scrollable.	2 Minor	Add a scroll bar or ensure the last visible item is partially cut off to signal that the list continues.	

7	Dropdown Loses Selection Context	Consistency & Standards	When re-opening the "Room" dropdown, the list resets to the top instead of scrolling to the currently selected item. This violates standard mobile platform conventions regarding pickers.	2 Minor	Ensure the dropdown component auto-scrolls to the currently selected value when opened.	
8	Unmapped Rooms are Selectable	Error Prevention	Users are able to select rooms in Building 2 that do not have navigation data implemented, leading to a failed action. The system allows an "illegal operation" to occur.	3 Major	Disable or remove rooms from the selection list that do not have valid navigation paths to prevent the error before it happens.
