

Good and Bad Interface Design

Example of a Good Interface

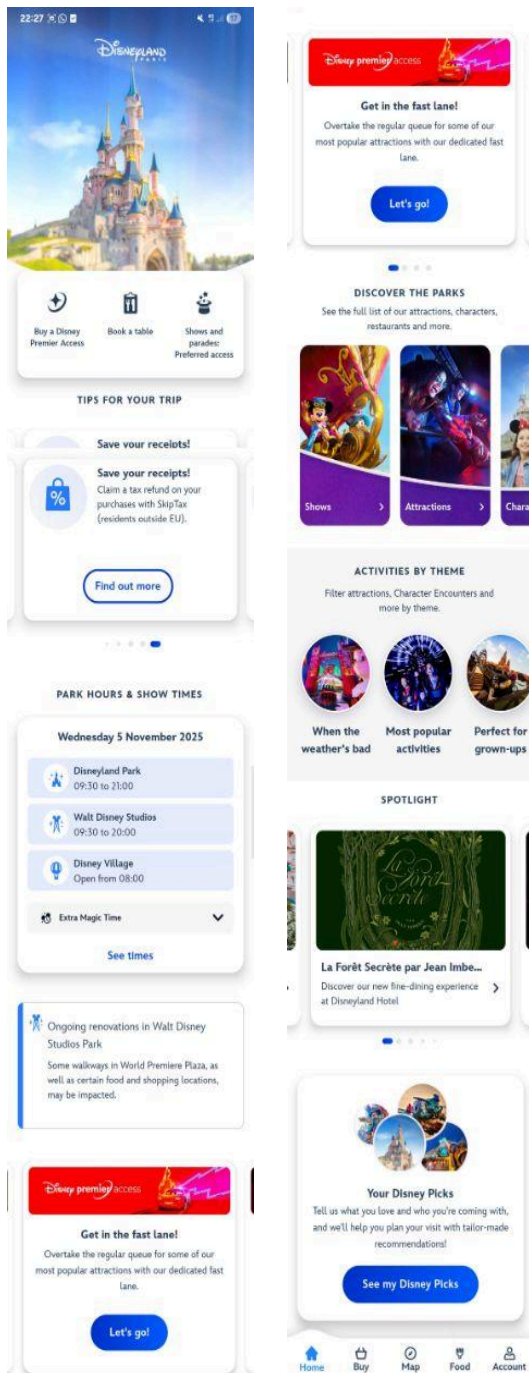

This is an example of a good interface design, with an overall clean and simple design that allows the user to easily navigate the application.

Application: This interface belongs to Youtube Music, a music streaming app.

Positive Points:

- The interface has a clean visual look, enhancing its readability and clarity
- The page doesn't show an overload of information, being simple and straightforward, allowing the user to quickly choose or find something to listen to without feeling lost or overwhelmed.
- The buttons and interactive elements are easy to understand and lead to other possibilities in case the user wants to explore new music, look at their own library or even filter the suggested content based on a specific mood.

Example of a Bad Interface

This is an example of a bad interface design, with a design that worsens clarity and complicates usability.

Application: This interface belongs to Disneyland, an app to guide visitors that go to Disneyland Paris.

Negative Points:

- The application has 5 main pages, but each of them has a lot of information or leads to another group of pages. This packed and complex design makes the application confusing and overwhelming for a first user.
- Some pages are accessible in more than one way, however certain navigation paths are redundant and overly complicated, while others are hidden among the large amounts of information condensed in some pages like the Home Page.
- Some of the information displayed is misleading or unclear (eg. The character meeting hours sometime display times where they aren't available, others display the times they are on breaks but no indication on it specifically)

Causes

The reason behind this flawed design is likely the vast amount of information that needed to be displayed for an application with this purpose, leading to cluttered layouts and extensive page navigation.

Improvements

This interface could be improved by restructuring the pages and filtering the information shown initially. This way it could present a design that makes it easier to follow for a new user, especially since its objective is to enhance and facilitate the experience visitors have in this theme park. Alternatively it could also be separated into a small group of simpler interconnected applications that work well together.
