Briefing

People trying to live healthier lives struggle to manage and coordinate training, recovery, and nutrition in one place. Existing health apps are fragmented, focusing majorly on only one area, which often overwhelms beginners or lacks the depth needed by advanced users. Our goal is to design a single, intuitive interface that provides a balanced and simple view across all three domains. By integrating these critical elements and providing appropriate detail for every user level, we aim to deliver a more successful and motivating path to fitness

Scenarios

Plan a Workout Routine

My name is Sofia Costa, I am 35 years old, I measure 163cm and weigh 57kg, and I've recently decided to take my fitness journey more seriously. To help with that, I started using the Forma app to create a plan that fits my lifestyle and goals. I'm focused on building muscle, but I want to do it in a way that feels natural and enjoyable. I choose exercises like squats and push-ups that are recommended by the app. I've organized my sessions throughout the week to maintain a balanced routine that aligns with my daily schedule, especially since I work until 5 p.m. every day. Once the plan is set, it becomes part of my dashboard

Track a Workout

My name is Marco Silva, a dedicated gym goer following a structured strength program. Today marks the second workout of my current plan. After opening the Forma app, I begin my session and start warming up, preparing for the main lifts. The workout begins with bench press and push ups. I take a moment to review the form cues provided and make sure my technique is good. As the session progresses, I keep track of my sets, repetitions and the resting time. Once the workout is complete, I review my performance summary, including training volume and heart rate trends. The app automatically updates my progress, showing the session as completed in my plan.

Search Healthy Recipes and Track Calories

My name is Beatriz Lopes, I enjoy cooking and maintaining a balanced diet. This evening, I'm in the mood for something light and nutritious for dinner. Using the Forma app, I explore healthy recipe ideas and decide on grilled salmon, which seems like a good choice for its simplicity and high protein content. After preparing the meal, I record it in my daily tracker to keep an eye on my calorie intake. The app adjusts my totals and recommends a small evening snack to help me meet my nutritional goals.

Observations

After conducting all the three tests in the classroom, we concluded that the overall feedback was very positive. All participants showed genuine interest in using Forma and recognized its potential. Though no interface is ever perfect, this helped us uncover several areas that could be refined to enhance the user experience even further.

The participants really appreciated the inclusion of exercise videos, noting that they were very helpful for understanding the execution of the different workouts, and some already thought about having something like this while using a similar app. They also valued the advantage over other apps of having a clear navigation between the different sections, namely training, nutrition and schedule.

However, some users identified specific issues and provided some suggestions. The recipe and nutrition sections were considered very useful but could benefit from clearer presentation of ingredients and more intuitive calorie tracking. For example, one user pointed out that, after choosing a recipe, the page listing the ingredients should be labelled as “ingredients” instead of the name of the picked recipe. They also found calorie counting somewhat ambiguous and suggested adding contextual guidance, for example a “snack tip” or a reminder when calories remain to be consumed.

Many users also praised the calendar interface for scheduling the exercises. They liked its clean and intuitive design, and the possibility of just dragging the workouts in the different spots, but they expected more flexibility. For example, the ability of adjusting the session duration directly from that screen, or rearranging them across different days, without leaving that section.

During workout tracking, users felt that having to input their number of repetitions and sets between each exercise disrupted the flow of training. They wanted to do that beforehand. Implementing this change would for sure make the workout experience more enjoyable.

Finally, one tester highlighted that the option to add custom exercises should have a higher degree of freedom, giving the possibility of providing new exercises with their own videos and notes.

In summary, the participants expressed enthusiasm and satisfaction with the Forma prototype, and the improvements suggested are mostly refinements rather than structural issues.
