1 - Workout Builder

Flexibility & Efficiency of use && User Control & Freedom

Description - On the workout builder screen, the first instinct, even with the suggested workout pre-selected, was to check all the exercises. Since the card for each exercise is pretty big and swipe motion is done horizontally, this didn't feel quick and it was hard to have a general idea of what the workout for that muscle group would look like.

Severity - 2

Solution - We believe reducing the size of the card by a small amount, removing unused space, and implementing a vertical scrolling motion rather than the horizontal would highly help with a quicker way of checking all exercises selected and non selected, making it easier to keep track of all exercises for that muscle group.

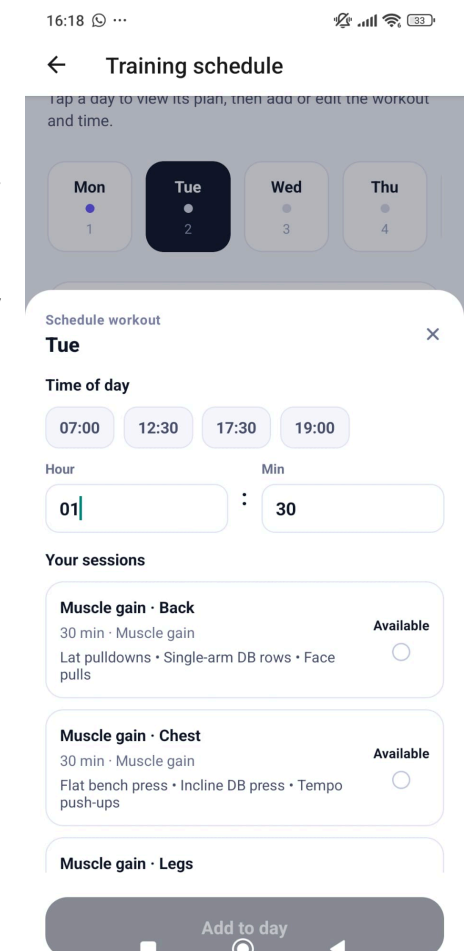

2 - Training Schedule

User Control & Freedom

Description - Couldn't choose any hour past ten am, for example 18h. The form, both for hours and minutes, only allows inserting the first number and immediately formats to '0' followed by the digit, preventing from giving as input any hour past 09:09.

Severity - 3

Solution - Not so much of a design problem rather than an implementation problem. Correct the bug by not restricting the form with formatting options.

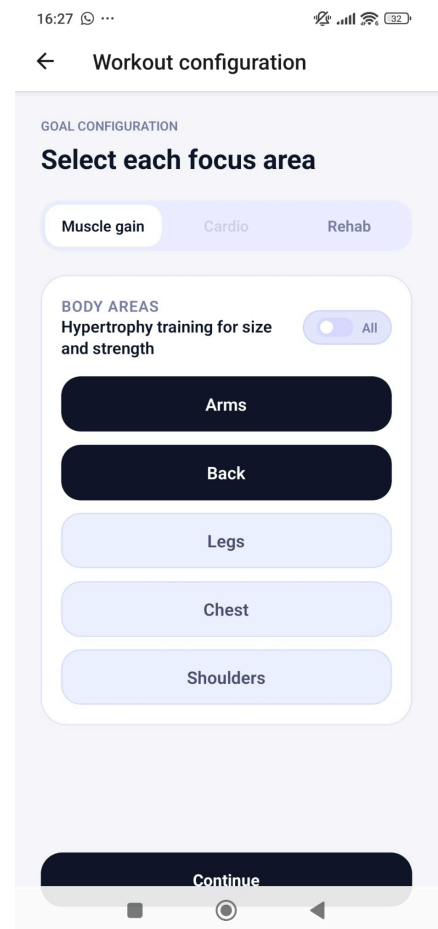

3 - Workout configuration

Visibility of system status

Description - The selection of groups is only identified by the different colors, this could be hard for colorblind people. But even for non color blind users it mixes with the continue button, which is a recurring nuisance throughout the application.

Severity - 3

Solution - We believe that a check mark symbol for marking selections is always a great way of showing the user the system status. This would immediately solve the color blind user problem.

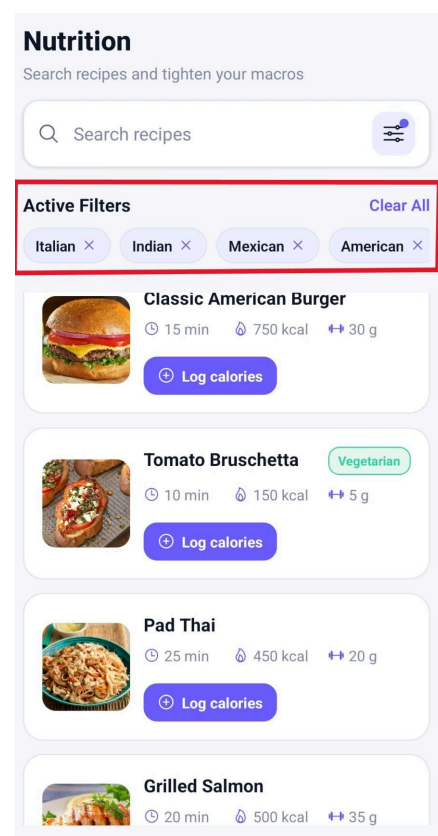

4 - Nutrition

Consistency & Standards and Visibility of system status

Description - The only way to see all the recipes is to select all the "Cuisine" options one by one and keep all the other options as default. Any other filter options would not list all.

Severity - 3

Solution - Adding an option to list all the recipes or showing them all as default would fix this problem.

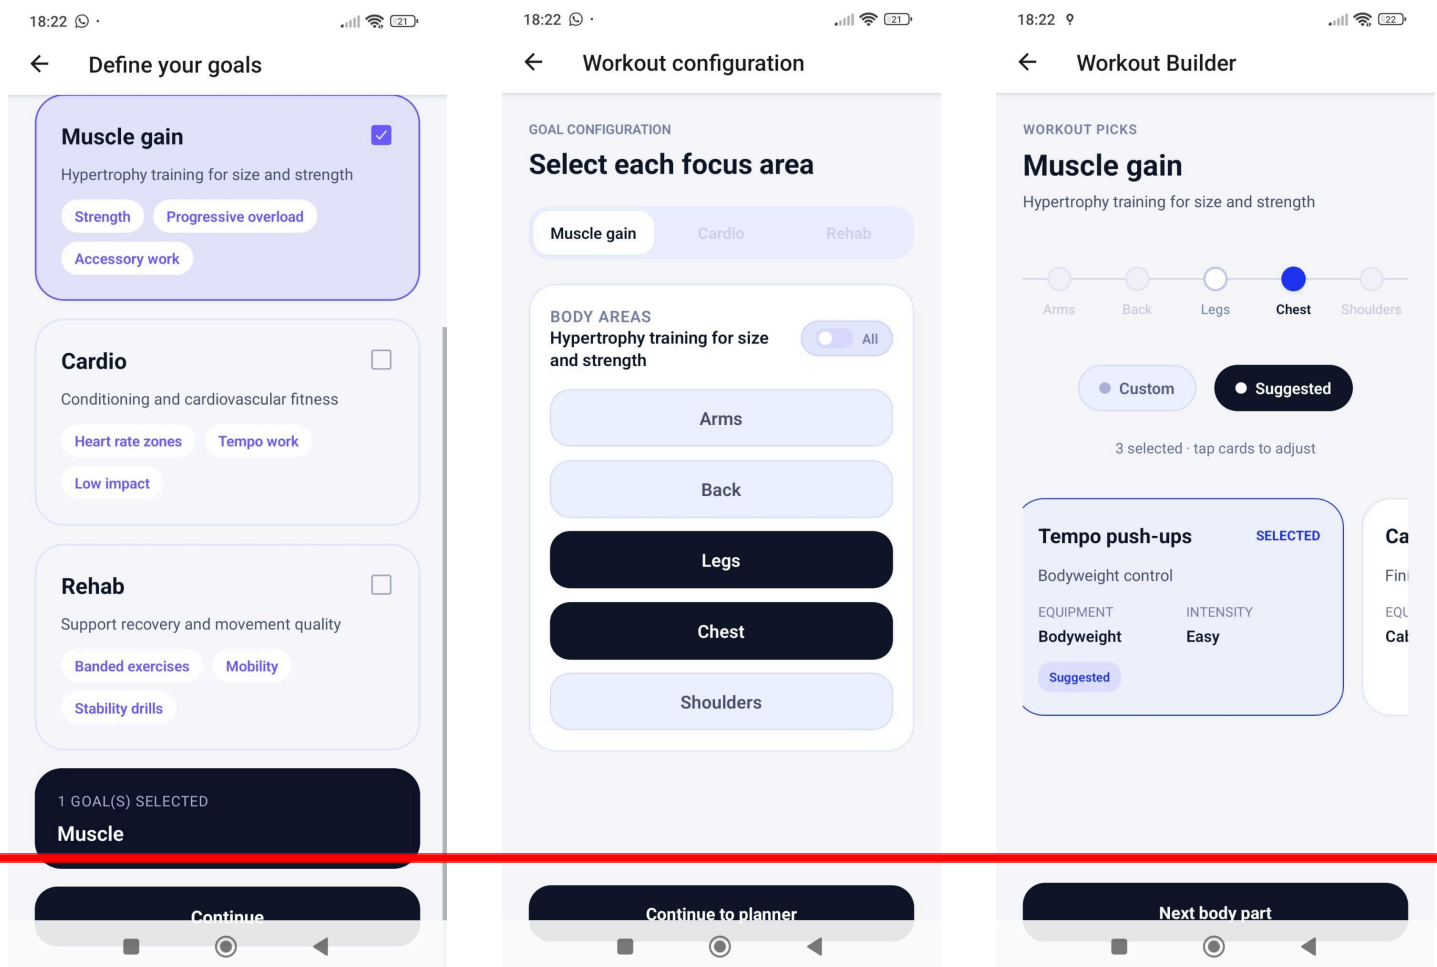

5 - Training Schedule

Visibility & Accessibility of Controls

Description - In the various menus and sections of the application, The android bar at the bottom of the screen, that is a very common and known standard, interfered with the buttons of the app, that were placed at the bottom of the screen. This choice of button position and the lack of handling the android bar properly, led to some awkward situations where pressing the buttons ended up being far more challenging than it should be, given that this action should be as simple as possible for the user.

Severity - 2

Solution - Either handle the android bar by putting the app in immersive mode so that the android top and bottom bars disappear and are only shown to the user when the specific gesture to make them appear is done, or reposition the buttons and alter the design of the app so that these are never too close to edges or places that could interfere with the underlying system, in this case, the android system.

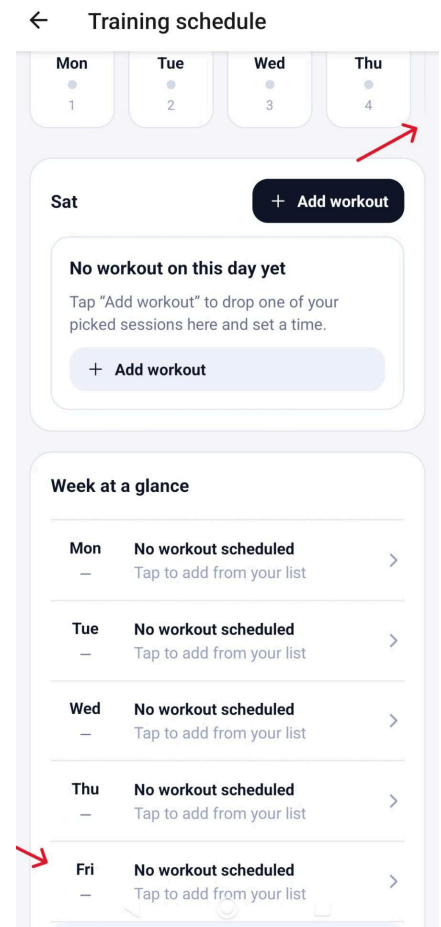

6 - Week at a glance

Visibility of system status

Description - Selecting a day on the “Week at a glance” that is not yet visible at the carousel, would render the selected day invisible.

Severity - 2

Solution - Making the carousel responsive to the active day or sizing it better so that all weekdays would appear at the same time would fix this problem.

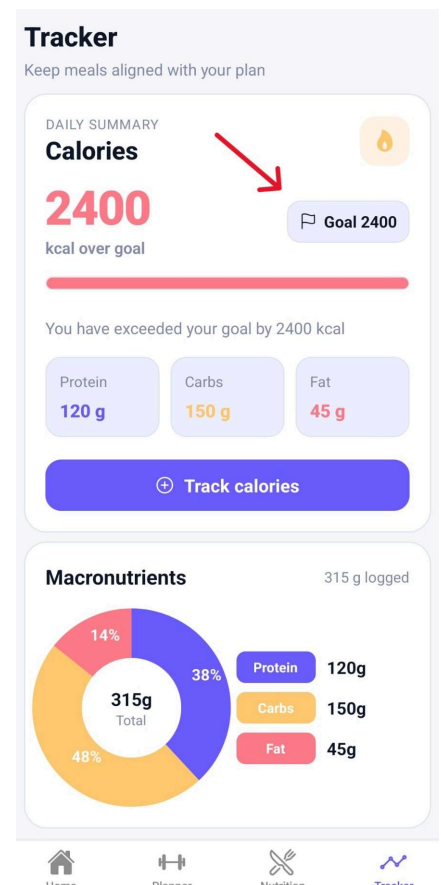

7 - Tracker

Consistency & Standards

Description - The goal box is similar to buttons that exist throughout the application, that first seems to indicate that I can change my calories goal, which is not the case.

Severity - 2

Solution - Changing the style of the box or adding an interaction so that the user can change the goal.

8 - Profile Setup

Color choice

Description - When setting up the profile, the create account button color is hardly visible.

Severity - 1

Solution - Changing the color to something with more contrast.

9 - Workout Configuration

Body part Selection

Description - When setting up the workouts for the different body parts, the order of the selection is the order of the sections (If I press “Arms”, then “Shoulders” then “Legs”, on the “Workout Builder” page, that is the order that the body part workouts get selected, while still keeping the order of the buttons). This can be a bit confusing for the user, since it looks like a section got skipped.

Severity - 1

Solution - Either changing the Workout Builder page so that the order selected shows up as selected or keeping the order that is shown regardless of the order selected by the user.

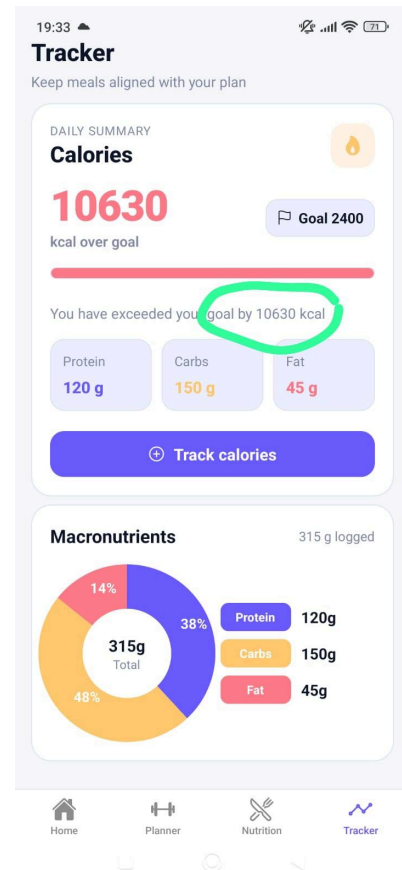

10 - Tracker

Calorie Tracker

Description - The user is not able to see what they ate or added to the calorie tracker and is not able to remove a selection even if added by mistake. Also, the calculation of the "excess amount of calorie goal" is incorrect, since it just shows the amount of calories logged, instead of the amount over the goal.

Severity - 2

Solution - Give the user the ability to see what they logged onto the calorie tracker and the ability to remove a selection and maybe add a confirmation message whenever the user chooses to log calories and correct the calculation of the calorie excess.

Prototype received date:

We (group 3) received group 7's prototype, on the 24th of November. And delivered the evaluation report on the 30th of November.
