1 - Workout Builder

Flexibility & Efficiency of use && User Control & Freedom

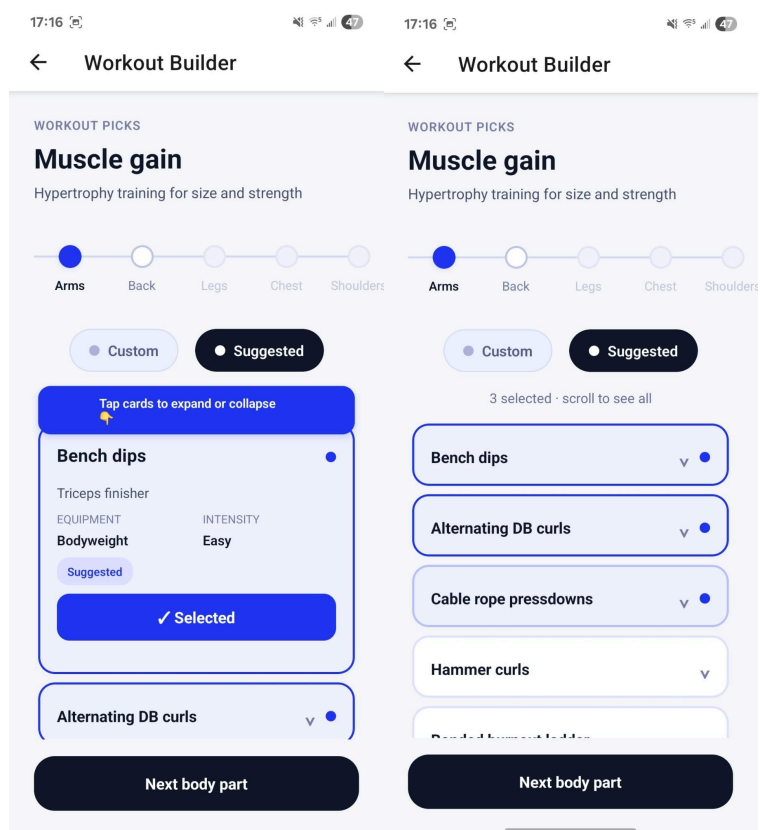

Description - On the workout builder screen, the first instinct, even with the suggested workout pre-selected, was to check all the exercises. Since the card for each exercise is pretty big and swipe motion is done horizontally, this didn't feel quick and it was hard to have a general idea of what the workout for that muscle group would look like.

Solution- We agreed with the evaluators that the original horizontal layout and large card size made it difficult for users to get a quick overview of their workout plan. To resolve this, we transitioned to a vertical scrolling list as suggested, which significantly improves the visibility of the selected exercises. We further refined this solution by implementing expandable and contractable cards. Additionally, to ensure this new interaction is immediately clear to users who might not find it intuitive, we implemented a one-time contextual hint that appears upon first opening the page, instructing users to tap a card to expand it

Before

After

2 - Training Schedule

User Control & Freedom

Description - Couldn't choose any hour past ten am, for example 18h. The form, both for hours and minutes, only allows inserting the first number and immediately formats to '0' followed by the digit, preventing from giving as input any hour past 09:09.

Solution- We corrected the bug

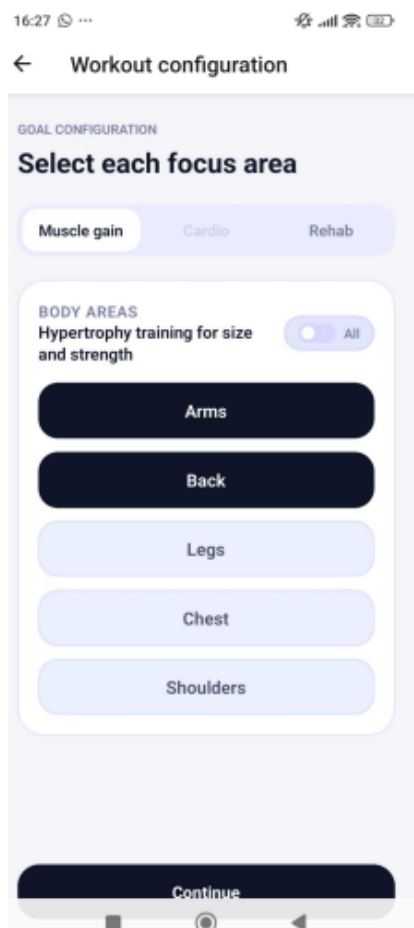

3 - Workout configuration

Visibility of system status

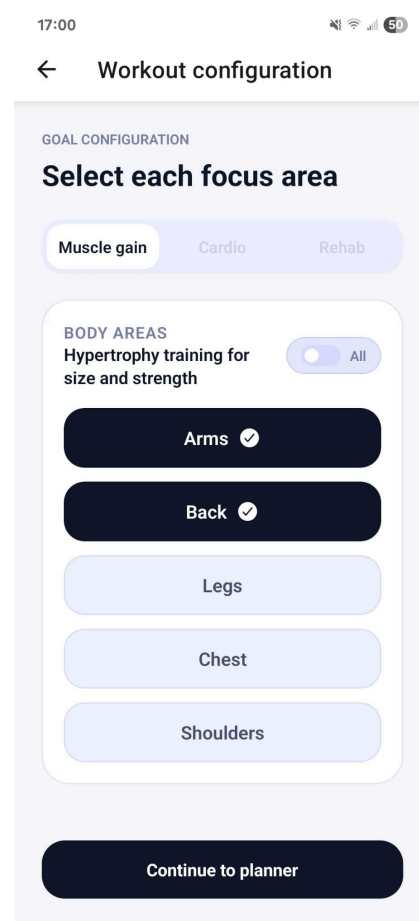

Description - The selection of groups is only identified by the different colors, this could be hard for colorblind people. But even for non color blind users it mixes with the continue button, which is a recurring nuisance throughout the application.

Solution- We agreed that relying purely on color violated usability best practices for indicating system status and accessibility. To resolve this, we implemented a checkmark symbol on the selected focus area buttons. This graphic indicator clearly communicates the selection state to all users, immediately solving the colorblindness issue and providing unambiguous feedback.

Before

After

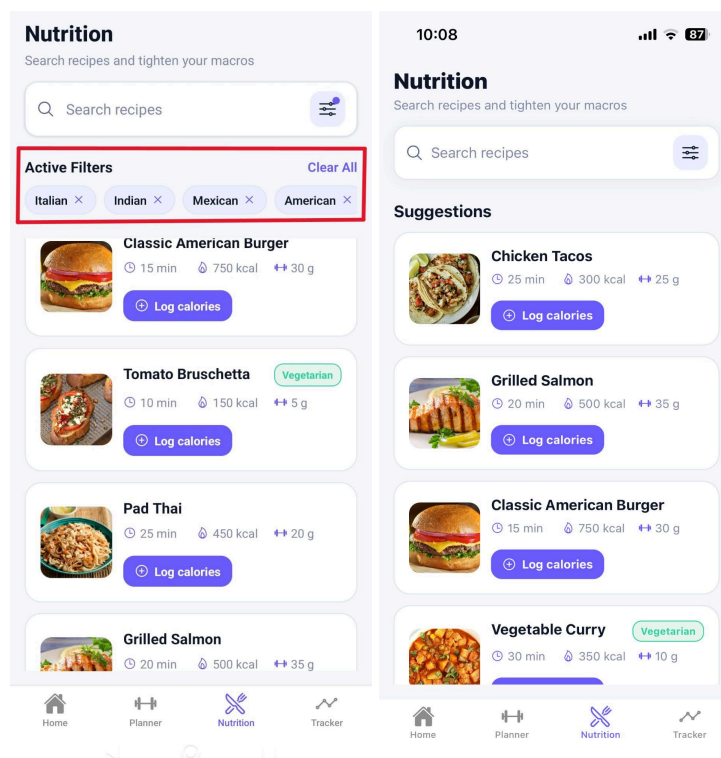

4 - Nutrition

Consistency & Standards and Visibility of system status

Description - The only way to see all the recipes is to select all the “Cuisine” options one by one and keep all the other options as default. Any other filter options would not list all.

Solution- We fixed the filtering logic so that users can now see all recipes without manually selecting every cuisine. Leaving filters empty correctly shows all recipes.

5 - Training Schedule

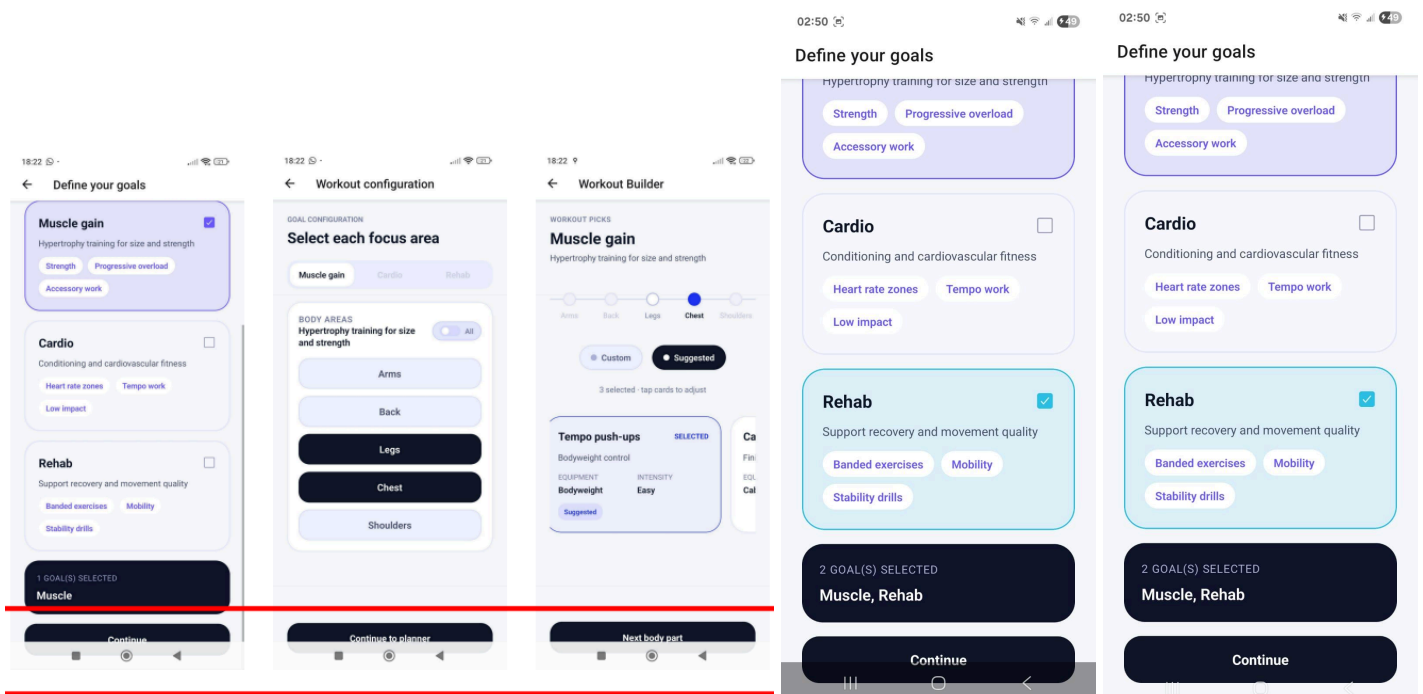

Visibility & Accessibility of Controls

Description - In the various menus and sections of the application, The android bar at the bottom of the screen, that is a very common and known standard, interfered with the buttons of the app, that were placed at the bottom of the screen. This choice of button position and the lack of handling the android bar properly, led to some awkward situations where pressing the buttons ended up being far more challenging than it should be, given that this action should be as simple as possible for the user.

Solution- We agreed that the overlay of the native Android system navigation bar with the application's primary action buttons created a major usability and accessibility issue. To fix this problem, we implemented the suggested immersive mode. This design choice removes the persistent visibility of the native Android navigation bar while the app is in use, preventing any interference with the application's controls and ensuring that high-priority actions remain easy and simple for the user to select.

Before

After

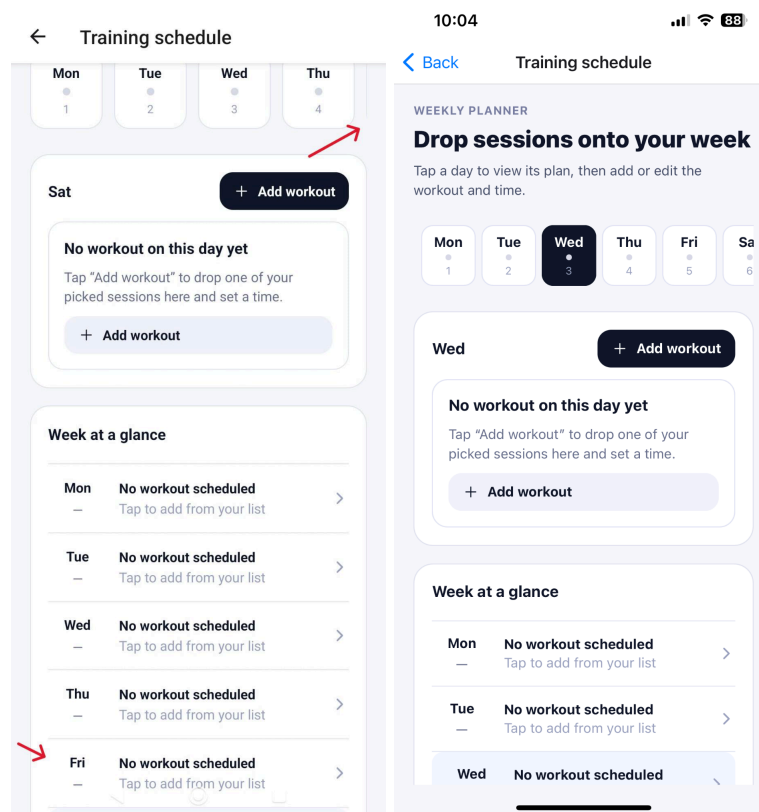

6 - Week at a glance

Visibility of system status

Description - Selecting a day on the “Week at a glance” that is not yet visible at the carousel, would render the selected day invisible.

Solution- We fixed the issue by ensuring that when a day is selected the carousel would scroll to it, making it visible. Additionally, we made weekday cells more condensed to improve visibility.

7 - Tracker

Consistency & Standards

Description - The goal box is similar to buttons that exist throughout the application, that first seems to indicate that I can change my calories goal, which is not the case.

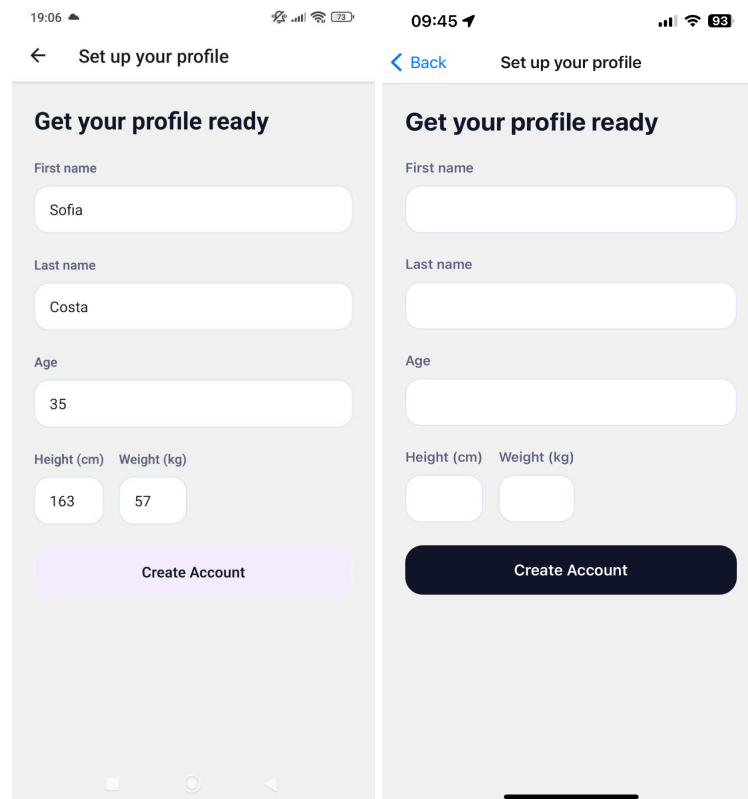

Solution- We changed the style of the button

8 - Profile Setup

Color choice

Description - When setting up the profile, the create account button color is hardly visible.

Solution- We made the background of the button dark.

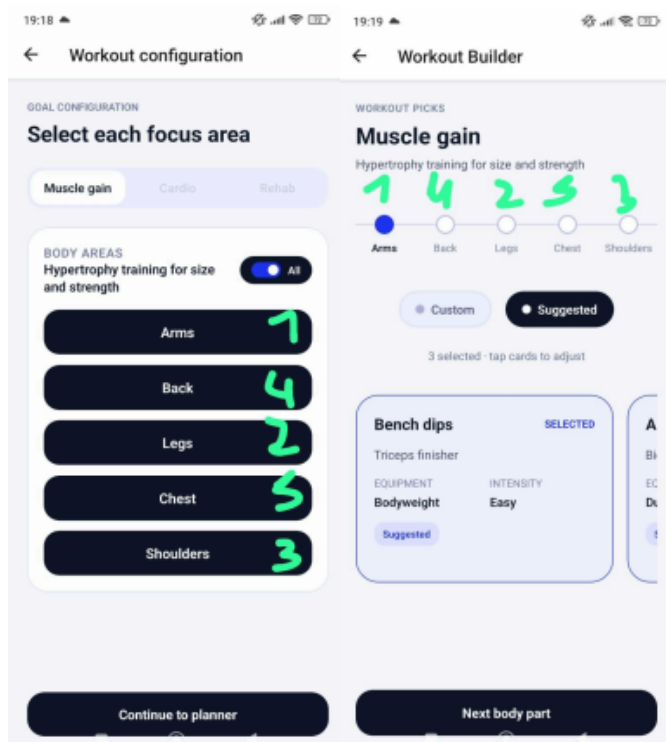

9 - Workout Configuration

Body part Selection

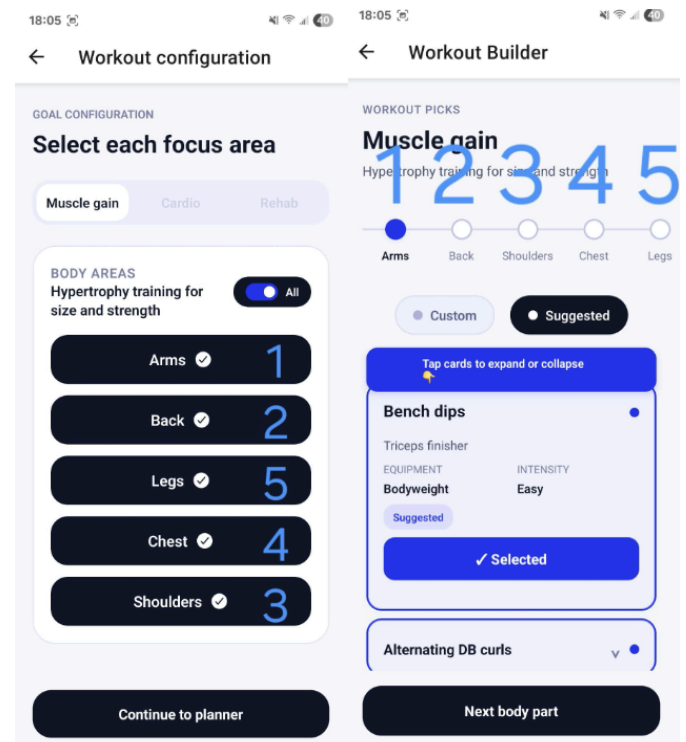

Description - When setting up the workouts for the different body parts, the order of the selection is the order of the sections (If I press “Arms”, then “Shoulders” then “Legs”, on the “Workout Builder” page, that is the order that the body part workouts get selected, while still keeping the order of the buttons). This can be a bit confusing for the user, since it looks like a section got skipped.

Solution- We acknowledged the evaluator's feedback that the mismatched order between the selection screen and the workout builder page was confusing, potentially leading the user to believe a body part was skipped. To address this Consistency issue, we implemented a fix ensuring that the order of the body part section displayed on the Workout Builder page now dynamically matches the exact sequence in which the user made their selections on the Workout Configuration screen.

Before

After

10 - Tracker

Calorie Tracker

Description - The user is not able to see what they ate or added to the calorie tracker and is not able to remove a selection even if added by mistake. Also, the calculation of the "excess amount of calorie goal" is incorrect, since it just shows the amount of calories logged, instead of the amount over the goal.

Solution- We redesigned the calorie tracker to display all logged items clearly and allow users to remove entries when needed. We also corrected the calorie-goal calculation so it now shows only the amount exceeding the user's set goal, rather than the total calories logged.
